

SMART CITY ASSISTANT

Bharat-Level Location-Aware Citizen Service App

CORE IDEA	Location → Understand → Connect → Report → Track
PLATFORM	Android Application
PRIMARY USERS	Citizens across India
KEY MODULES	Emergency • Civic Issues • Transport • Nearby Services • Government • AI

Prototype purpose: Demonstrate how one Android app can use the user's location to surface relevant emergency contacts, nearby services, civic reporting, transport and government information.

Prototype Screens & User Flow

The prototype focuses on the core citizen journey. Location is the common layer connecting emergency, nearby services, civic complaints and transport.

1	Splash / Onboarding
2	Location Permission
3	Smart Home
4	Emergency / Nearby
5	Report Problem
6	Transport / Navigation
7	Complaint Tracking
8	AI Assistant

Screen 1 — Smart Home Dashboard

The home screen is designed around immediate actions instead of a long service directory.

Screen 2 — Emergency & Nearby Help

One-tap access to verified emergency contacts and nearby facilities. The final app should use verified official/local datasets.

Screen 3 — Report a Civic Problem

The citizen submits photo + location + category. A future backend can route the complaint to the responsible local authority.

The image shows a mobile application interface for reporting a civic problem. At the top, the status bar displays the time 9:41 and three dots. Below this is a dark blue header with the title "Report Problem". The main content area has a light blue background. It starts with a location field containing "Madhubani, Bihar". Below this is a large white rounded rectangle with a thin black border and a small camera icon, labeled "Add / Capture Photo". Underneath are six category buttons in light blue rounded rectangles: "Garbage", "Pothole", "Streetlight", "Water", "Drainage", and "Other". Below these is a text input field with the placeholder "Description:". At the bottom of the form is a light blue button with the text "Location detected automatically". Finally, at the very bottom is a large, dark blue rounded button with the text "SUBMIT COMPLAINT" in white capital letters.

9:41

Report Problem

■ Madhubani, Bihar

■ Add / Capture Photo

■ Garbage ■ Pothole

■ Streetlight ■ Water

■ Drainage • Other

Description: _____

■ Location detected automatically

SUBMIT COMPLAINT

Screen 4 — Complaint Tracking

A complaint is not considered complete just after submission. The citizen can see status and re-open/escalate if the issue remains unresolved.

Screen 5 — Location-Based Transport

Transport combines nearby public transport, route planning, traffic and road-issue reporting.

Screen 6 — Nearby Essential Services

Screen 7 — AI Smart Assistant

AI is an optional advanced layer. The prototype demonstrates intent detection; production use would require a secure AI service and verified data sources.

Prototype → Android Studio Implementation Plan

Layer	Recommended technology	Purpose
UI	Kotlin + Jetpack Compose	Screens, navigation, responsive UI
Location	Android Location Services	Current GPS / area detection
Maps	Google Maps SDK / Maps APIs	Nearby places, routes, navigation
Backend	Firebase	Authentication, database, storage
Database	Cloud Firestore	Users, complaints, status
Notifications	Firebase Cloud Messaging	Complaint/city alerts
AI	Secure AI API (later)	Natural-language assistant

Recommended development order

1. Build the UI screens and navigation.
2. Add location permission and current-location display.
3. Add nearby services and map/navigation.
4. Build civic complaint form with photo + GPS.
5. Connect Firebase for login, complaints and status.
6. Add notifications and verified data sources.
7. Add AI assistant and multilingual support as advanced features.

Prototype note: This document is a UI/UX concept for an academic project. Emergency numbers, government contacts, transport data and responsible departments should be verified from official sources before real-world deployment.
